About

Senior Frontend Engineer with 10+ years building and evolving modern web applications across e-commerce, media, healthcare, and insurance.

Led frontend architecture work, application modernization, and cross-functional delivery on business-critical products, with deep experience in React ecosystems, GraphQL-based architectures, performance optimization, developer experience, and technical leadership.

Focused on building maintainable software, mentoring engineers, improving development workflows, and shipping products that balance technical quality with business goals.

Experience

Feb 2023 – Jul 2026
3 yrs 6 mos

Senior Fullstack Engineer

Riverside.fm

Led technical initiatives within the Recording Studio, the company's core product area, focusing on scalability, performance, and long-term maintainability.

- Improved the Recording Studio platform architecture to better support scalability and long-term maintainability
- Decomposed core business logic into GraphQL-powered microservices, enabling a more modular platform architecture
- Reduced frontend complexity through large-scale technical refactoring that improved maintainability
- Introduced AI-assisted engineering workflows and code review automation to streamline development practices
- Delivered features across engineering teams for one of the company's most business-critical products

GraphQL

Microservices

Feb 2021 – Jan 2023
2 yrs

Frontend Team Lead

Realworld One

Started as a Frontend Engineer and progressed into a Team Lead role responsible for both technical delivery and team management.

- Built and evolved a client-facing VR/AR healthcare platform used to deliver product improvements
- Improved delivery planning and team coordination across engineering workstreams
- Expanded the team by contributing to hiring and recruitment efforts
- Strengthened team growth through mentoring and resource planning
- Shipped product improvements in close partnership with stakeholders

Team Lead

Jan 2020 – Feb 2021
1 yr 2 mos

Senior Frontend Engineer

Westwing Home & Living

Played a key role in one of the company's largest frontend modernization initiatives.

- Advanced the platform migration toward a decentralized micro frontend architecture
- Built and maintained a shared UI kit that improved consistency across frontend teams
- Migrated core checkout and payments functionality to support the broader modernization effort

Micro frontends

Nov 2015 – Oct 2018
3 yrs

Senior Frontend Engineer

Mercado Libre

- Built and maintained purchase flow functionality across the platform
- Rolled out purchase flow initiatives across multiple Latin American countries
- Improved automation processes and engineering quality
- Strengthened testing practices within the engineering team
- Delivered scalable solutions in collaboration with multiple product teams

TODO(agustin): confirm whether the Oct 2018 – Jan 2020 gap should be shown.

Key achievements

35%

Scalability enhancement

Increased platform scalability by 35% through microservices architecture.

40%

Code review optimization

Reduced code review time by 40% with an AI-assisted workflow.

98%

Stakeholder satisfaction

Led a team that delivered 98% stakeholder satisfaction.

25%

Frontend optimization

Improved frontend load times by 25% with UI optimizations.

DRAFT · PREVIEW ONLY

Recording Studio architecture

Decomposing core business logic into GraphQL-powered microservices so the studio platform could scale without the frontend growing with it.

TODO(agustin): live link, if any can be public

ROLE
Senior Fullstack Engineer

PERIOD
Feb 2023 – Jul 2026

STACK
GraphQLReactMicroservices

The problem

The Recording Studio is the company's core product area, and its business logic had grown into the frontend. Scaling it meant untangling that first.

TODO(agustin): two or three sentences of context you are comfortable publishing.

Approach

- 01 Improved the platform architecture to better support scalability and long-term maintainability.
- 02 Decomposed core business logic into GraphQL-powered microservices, enabling a more modular platform architecture.
- 03 Reduced frontend complexity through large-scale technical refactoring.
- 04 Introduced AI-assisted engineering workflows and code review automation.

Outcomes

35%

more platform scalability through the microservices architecture.

40%

less time in code review after the AI-assisted workflow landed.

TODO(agustin)

One more outcome, with a number if you can publish one.
